

This termination should never be used. The program should be contained within the functions. It is here in case the program fails, so it can shut it down.

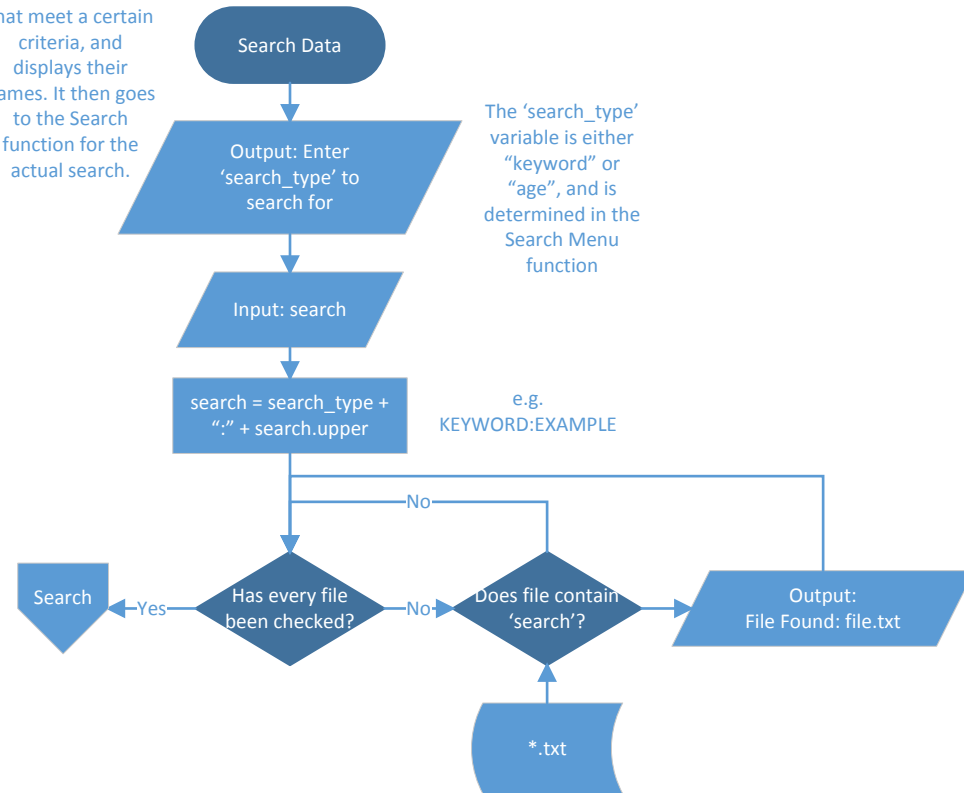

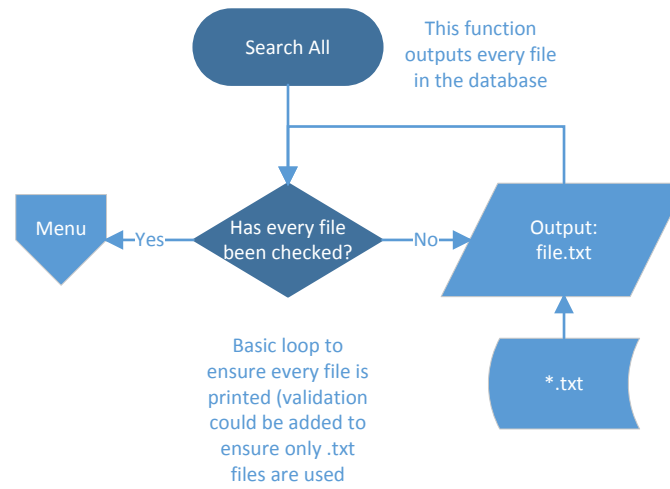

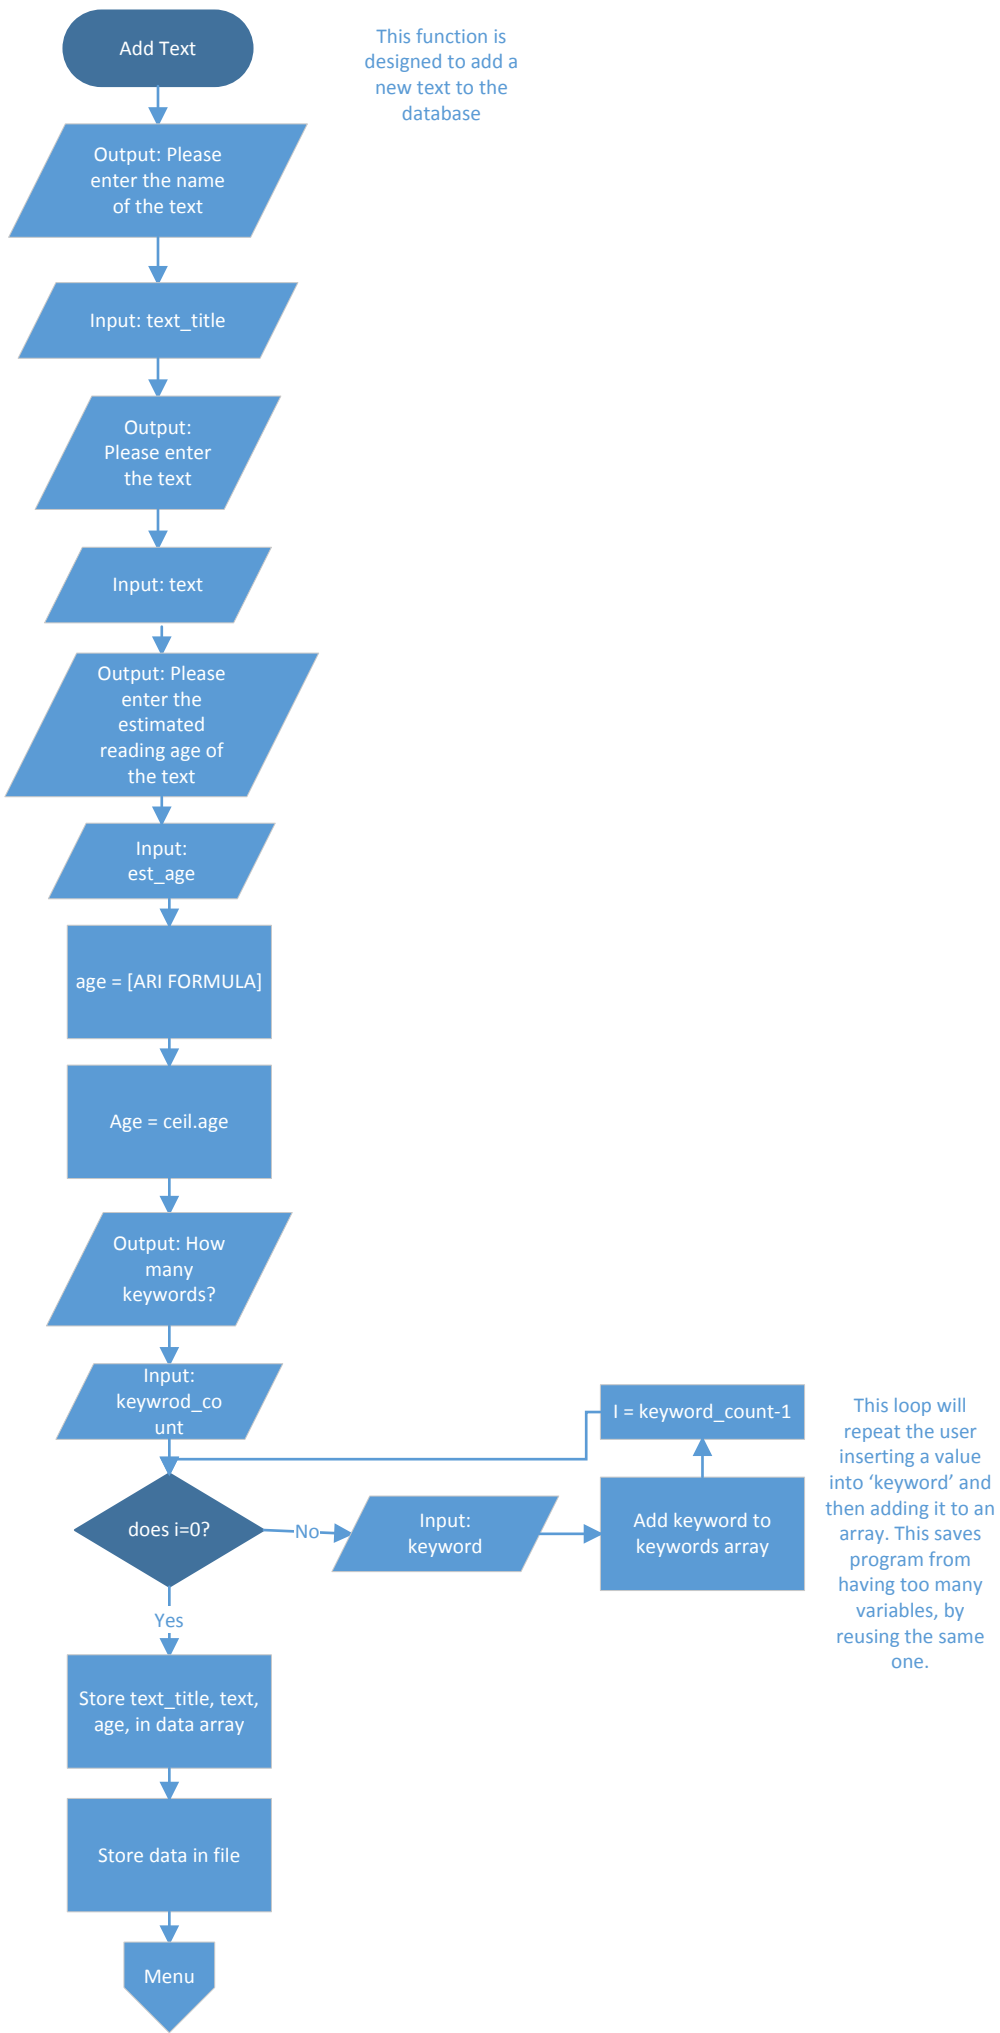

This function searches for files that meet a certain criteria, and displays their names. It then goes to the Search function for the actual search.

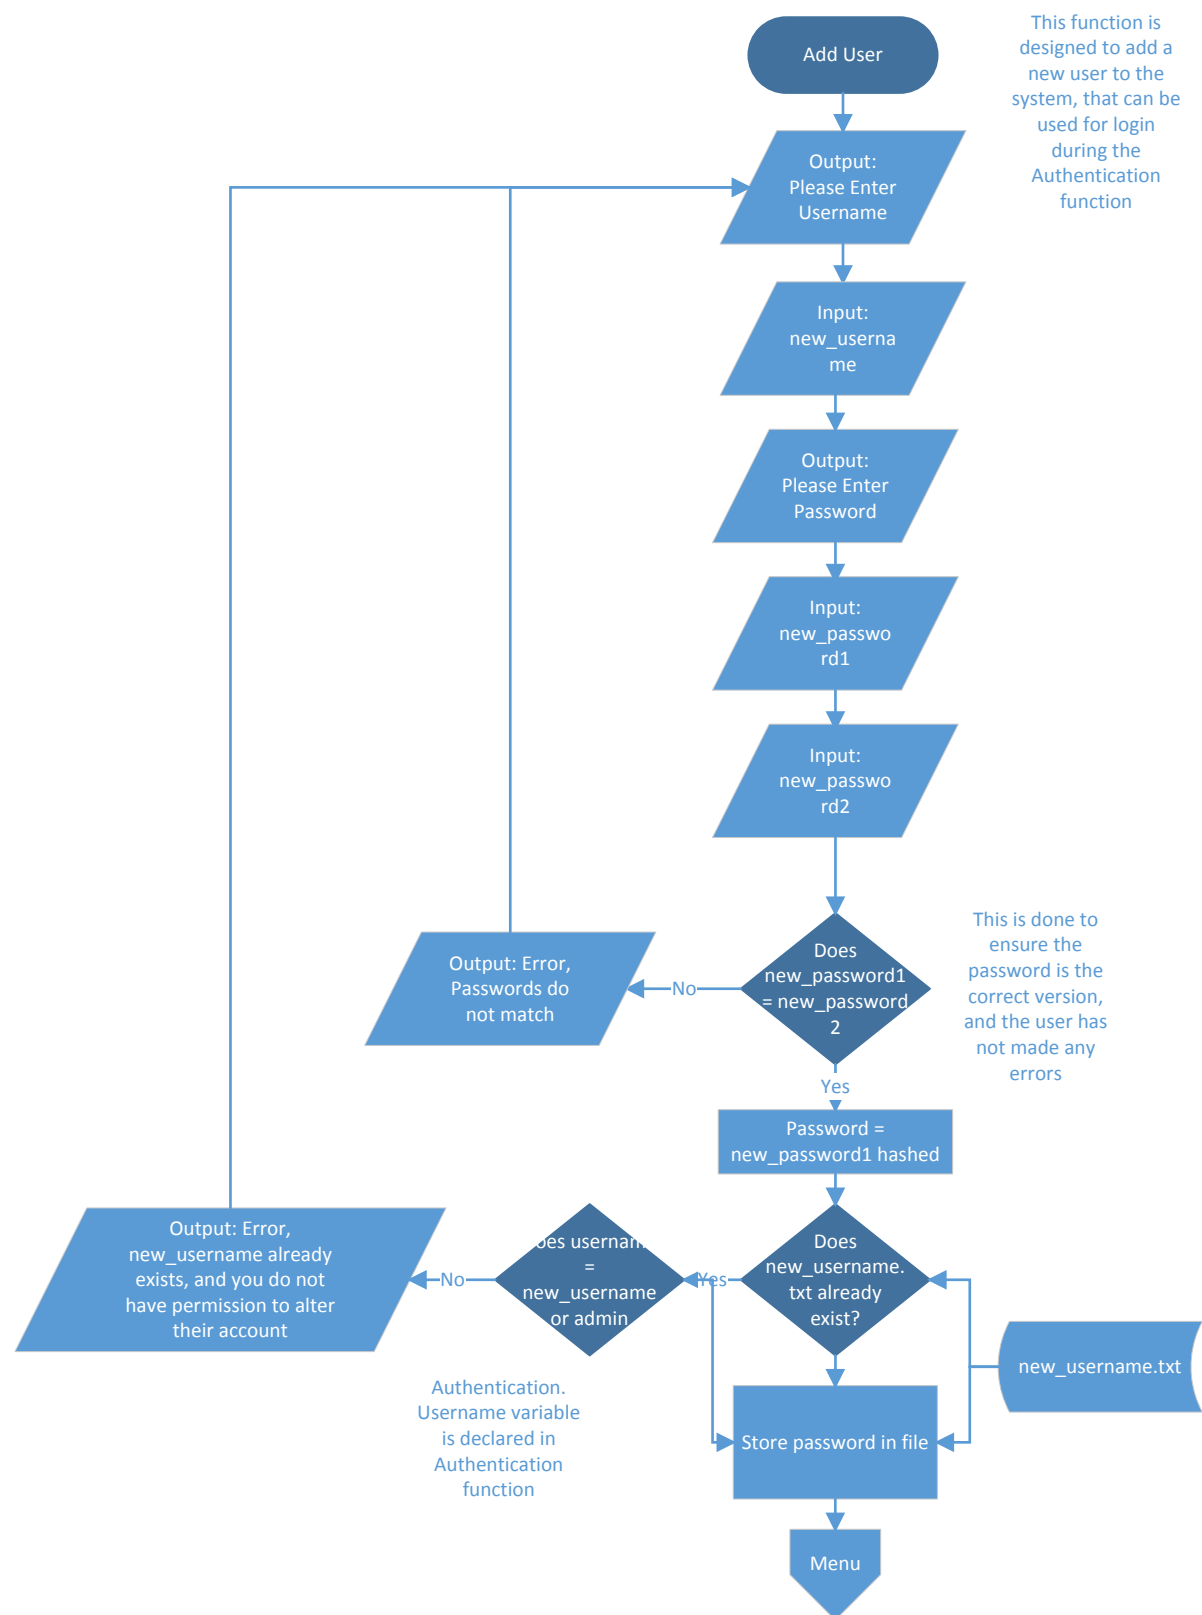

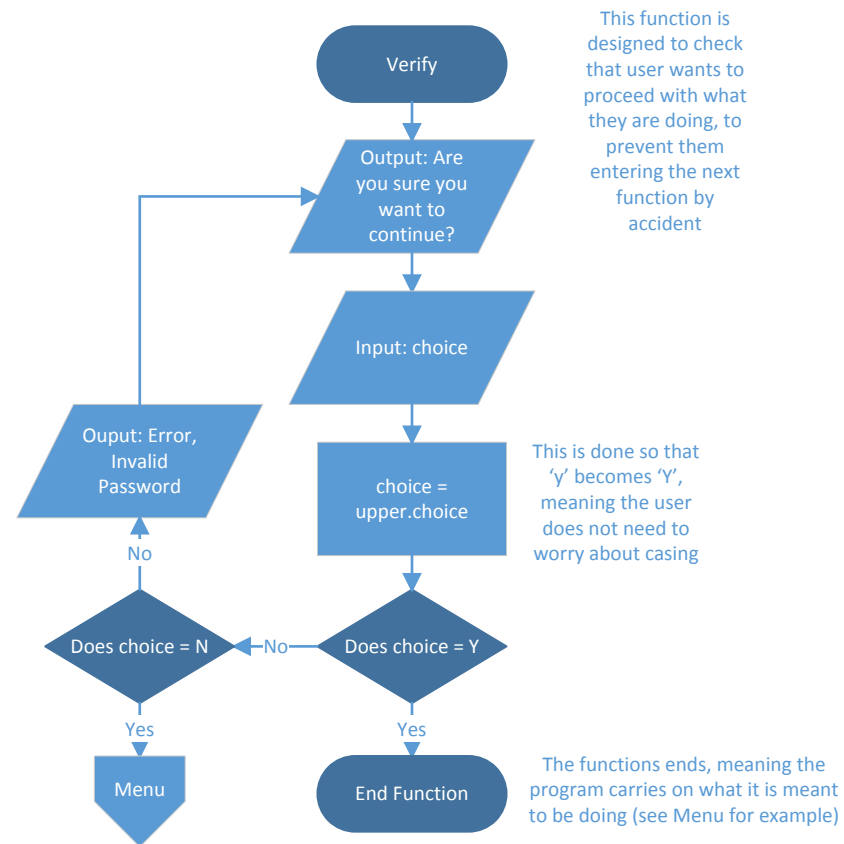

The 'search_type' variable is either "keyword" or "age", and is determined in the Search Menu function

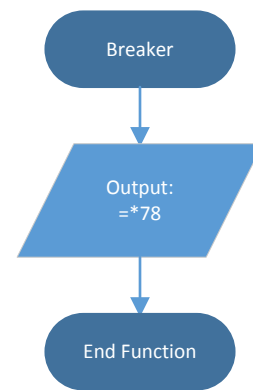

e.g.
KEYWORD:EXAMPLE

The purpose of this function is simply to print a line of '=' to make the GUI more user friendly

This function is never called in this flowchart, as there would be too many, and not worth it. However in the actual program, this function will usually be called at the beginning and end of every function

Begin Breaker

Clear console

End Function

The purpose of this function is simply to clear the console, to make the GUI look nicer

This function is never called in this flowchart, as there would be too many, and not worth it. However in the actual program, this function will usually be called at the beginning and end of every function
